Contents

1 Install the ViaBill Payments Module

2 Configure the ViaBill Payment Gateway

3 Authorize, Capture, Refund and Void a Payment

4 Best Practices

– Support

1 Install the ViaBill Payments Module

Download the module

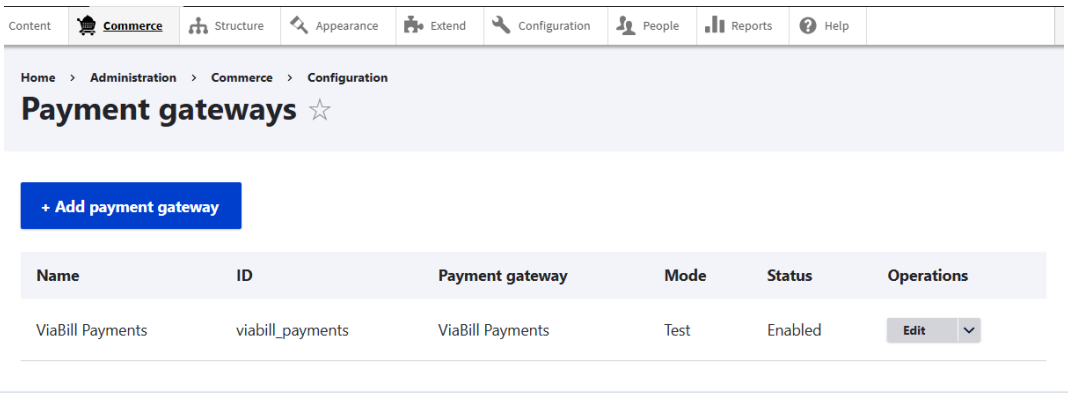

Download the module's **viabill_payments.zip** file and place its extracted contents in your **{drupal root directory}/web/modules/custom** directory. After the file transfer, you should have the following file structure:

```
{drupal root}/web/modules/custom/viabill_payments/css
{drupal root}/web/modules/custom/viabill_payments/src
{drupal root}/web/modules/custom/viabill_payments/composer.json
{drupal root}/web/modules/custom/viabill_payments/viabill_payments.commerce_log_templates.yml
...
```

Enable the module

Navigate to **Extend** in your Drupal admin menu, locate “ViaBill Payments”, and check the box next to it. Then click **Install** at the bottom. Or use Drush:

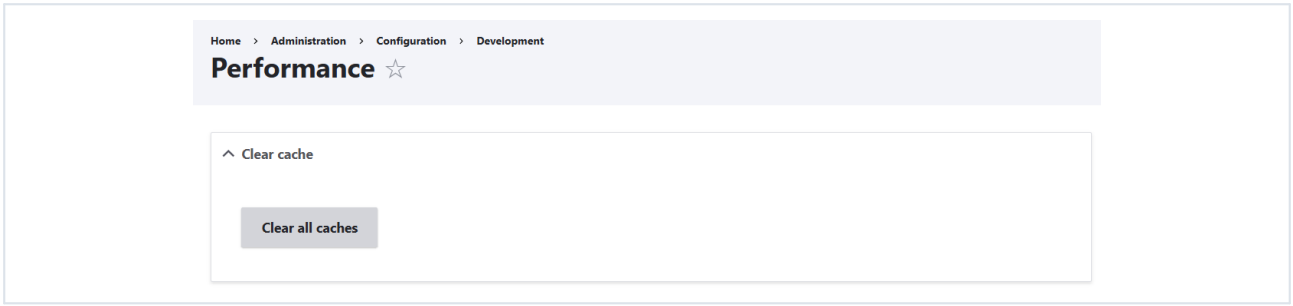

```
drush en viabill_payments
```

Once the module is enabled, the ViaBill Payments gateway becomes available under Commerce

Clear caches

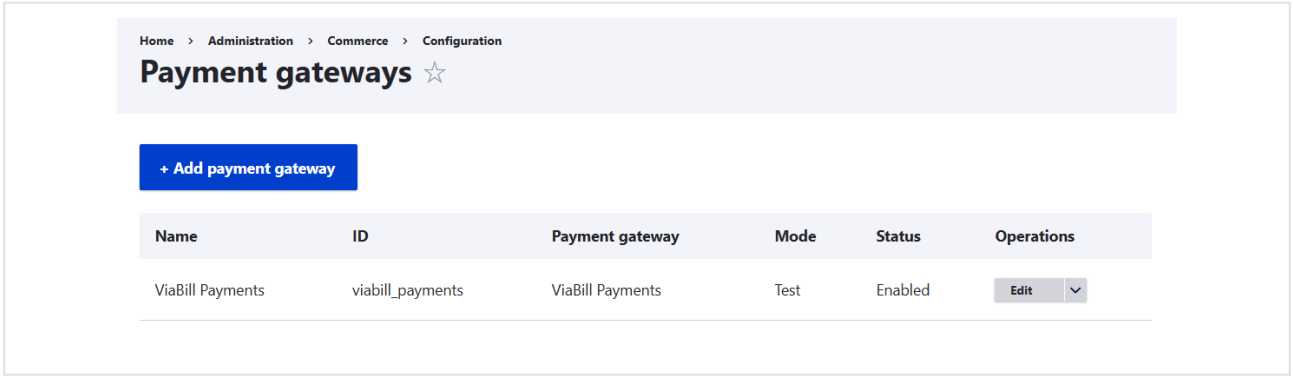

It's always a good idea to clear Drupal caches after installing a new module. In the admin UI, go to **Configuration** → **Development** → **Performance**, then click **Clear all caches** (or run **drush cr** in the terminal).

The Performance page with the Clear all caches button

2 Configure the ViaBill Payment Gateway

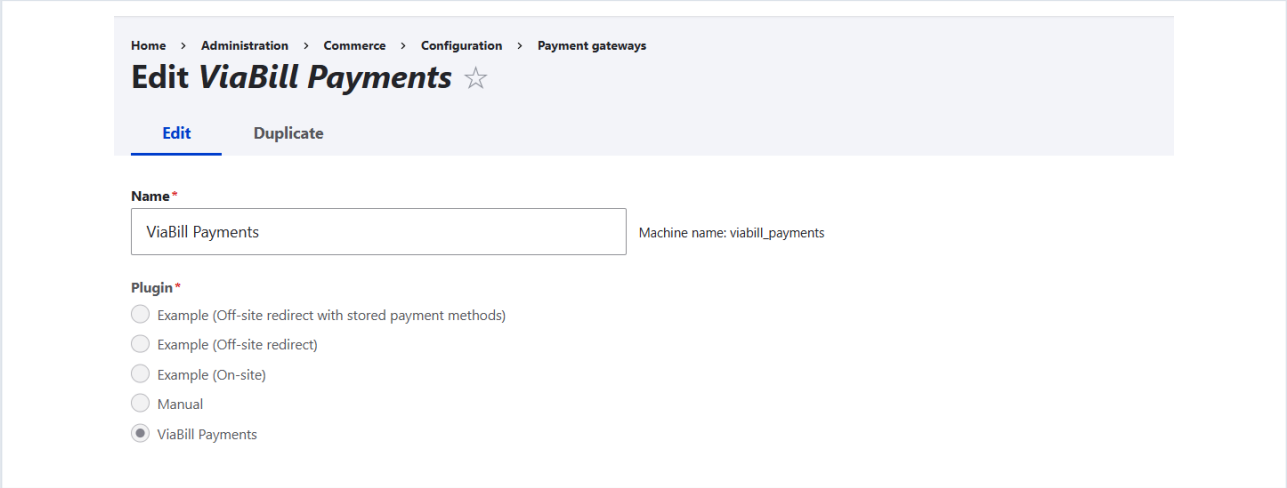

In Drupal Commerce, navigate to **Commerce** → **Configuration** → **Payment Gateways**. Click **Add payment gateway** (or edit if ViaBill Payments is already listed).

The Payment gateways page with the Add payment gateway button

Select ViaBill Payments

Under “Payment Gateway Plugin”, select “ViaBill Payments”. Give your payment gateway a **Label** (e.g., “ViaBill Payment”).

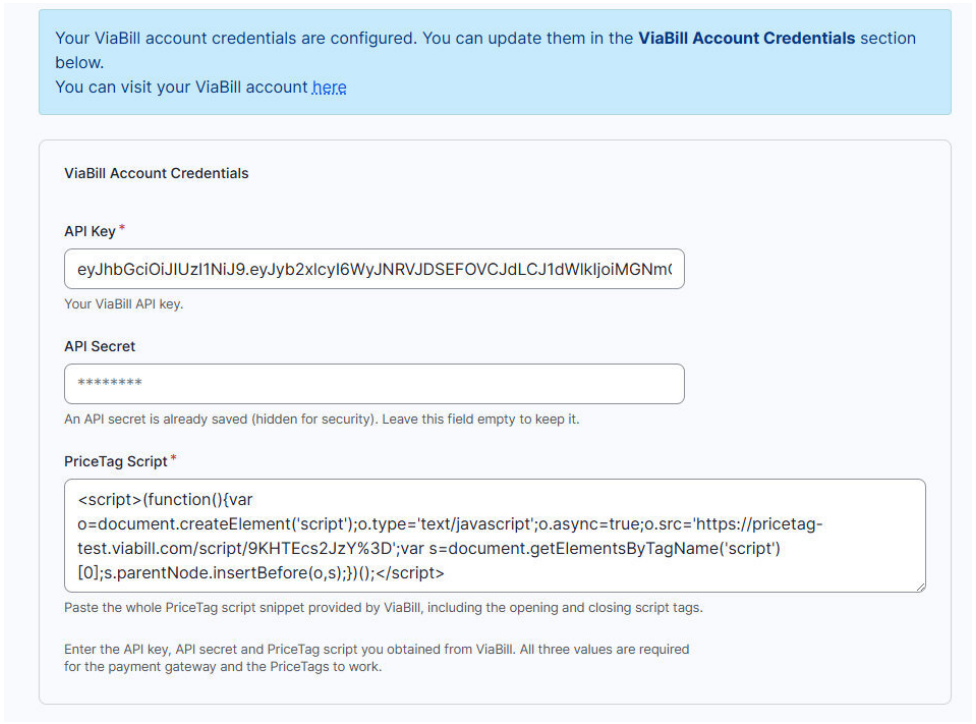

Selecting the ViaBill Payments plugin and setting the gateway name

Enter your ViaBill account credentials

Once you have installed the ViaBill Payments module, fill in the **ViaBill Account Credentials** section with the following values from your ViaBill merchant account:

• **API Key** – your ViaBill API key
• **API Secret** – your ViaBill API secret. If an API secret is already saved, it is hidden for security. Leave this field empty to keep it.
• **PriceTag Script** – paste the whole PriceTag script snippet provided by ViaBill, including the opening and closing script tags.

All three values are required for the payment gateway and the PriceTags to work. Once saved, a confirmation banner shows that your ViaBill account credentials are configured; you can update them in the ViaBill Account Credentials section at any time, or visit your ViaBill account via the link in the confirmation.

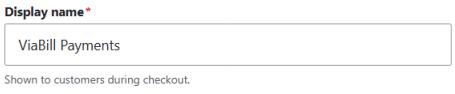

The ViaBill Account Credentials section with the API Key, API Secret and PriceTag Script fields

NEW TO VIABILL?

If you don't have a ViaBill account yet, create one by completing the signup process at https://portal.viabill.com/signup. Once registered, you can find all three values directly in your ViaBill merchant account. Please note that ViaBill Payments are available to merchants that have a legal address in Denmark or Spain. Make sure to contact ViaBill to provide all the required documentation to complete the registration, if you haven't done it already.

Display Name

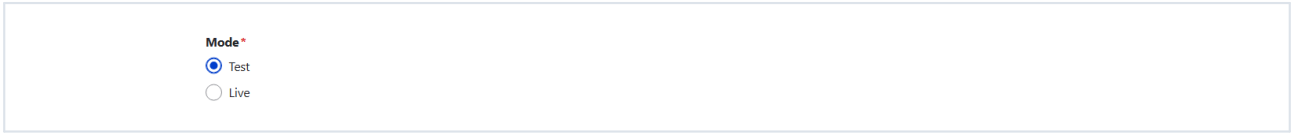

Set the Display Name to something descriptive, e.g., “ViaBill – Buy Now, Pay Later.” This is what customers will see during checkout.

The Display name field

Mode (Test vs. Live)

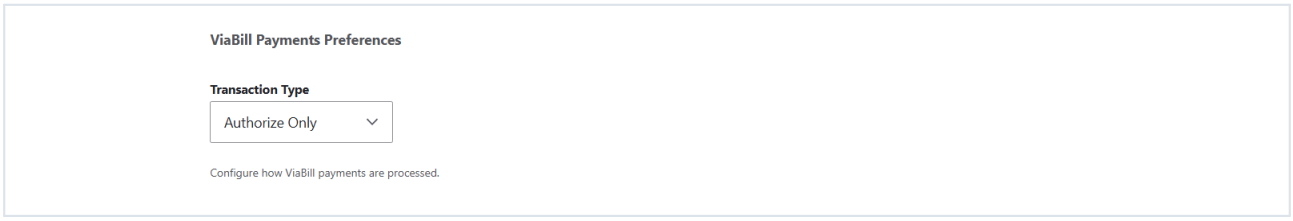

Use **Test Mode** for sandbox/test transactions. This is essential when you want to verify that everything works correctly before going live. Switch to **Live Mode** once you're ready to process real customer payments.

The Mode setting with Test and Live options

Transaction Type

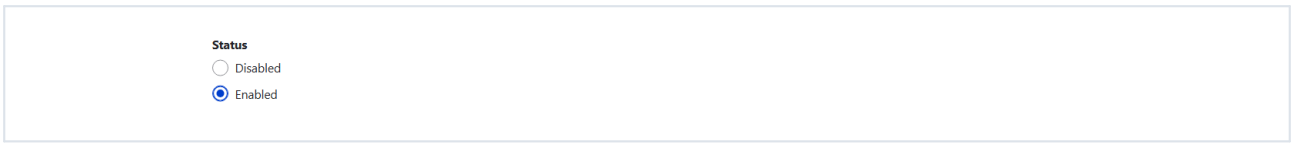

Authorize only: Reserves the funds on the customer's card (or in their ViaBill account) but does not actually charge (capture) them yet. You will capture the funds later, usually via your commerce order workflow.
Authorize and Capture: Charges the customer immediately upon checkout completion.

The Transaction Type setting

Status (Enable/Disable)

In the **Status** field, choose **Enabled** to activate ViaBill as a payment option. Switch to **Disabled** if you need to temporarily or permanently turn off this payment method.

The Status setting

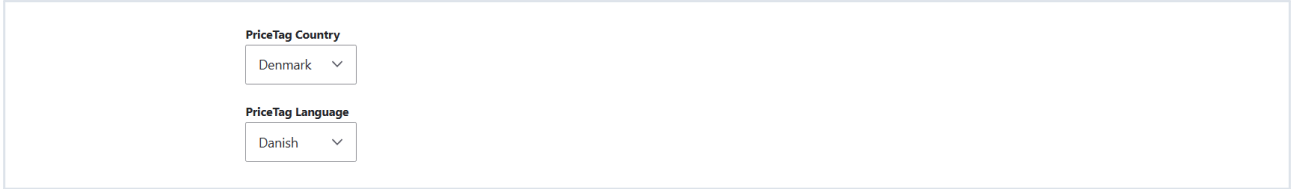

PriceTags Configuration

ViaBill's PriceTag is the key to your success as a ViaBill partner. The PriceTag immediately shows your customers how much they have to pay per month if they choose to pay with ViaBill. This way you maintain the customers' interest and avoid losing customers who would otherwise have abandoned the purchase.

Use the following configuration parameters to either let the module insert the PriceTags automatically into the various pages (product, cart, checkout) or follow the instructions to insert them yourself.

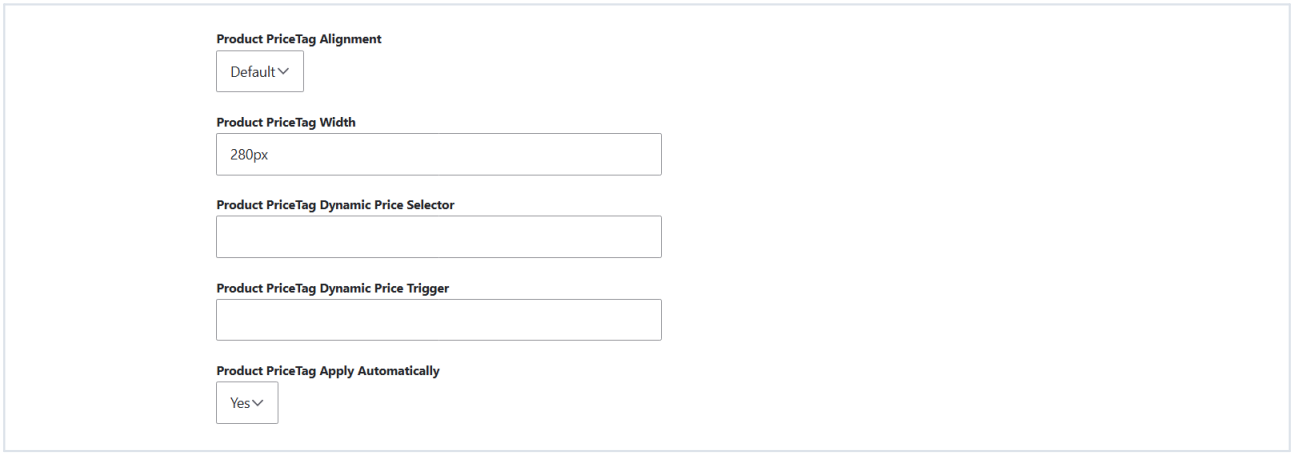

PriceTag Country and Language

Use these option fields to specify explicitly the country and language of your shop. If you don't, the module will try to detect these values automatically.

The PriceTag Country and Language settings

PriceTag for the Product Page

The Product PriceTag settings

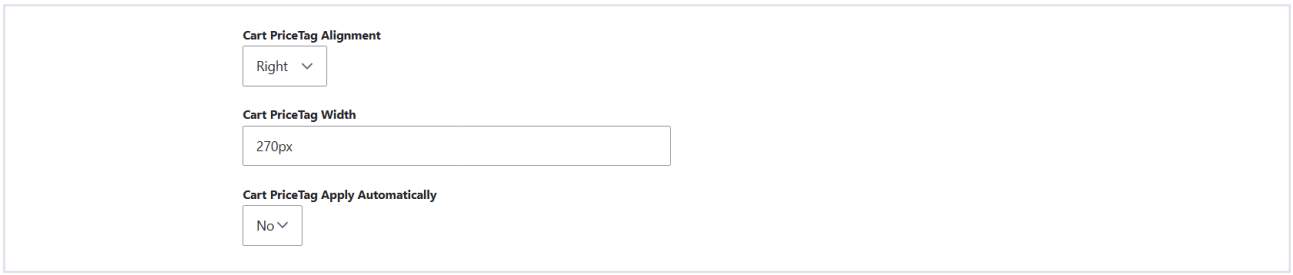

If you set the “Product PriceTag Apply Automatically”, the PriceTag will be inserted automatically below the product price. If this does not work, you can manually insert the PriceTag in the proper twig template file (e.g. **modules/contrib/commerce/modules/product/templates/commerce-product.html.twig**), using the following tag:

```
{% if viabill_pricetag %} {{ viabill_pricetag }} {% endif %}
```

For the PriceTag alignment (left, center, right) you can use the value of the “Product PriceTag Alignment”. The PriceTag width also plays a significant role in the alignment and you can use it, especially when the “Right” alignment is selected.

For the Dynamic Price Selector values, have a look at the tutorial at **viabill.io/api/pricetag/**. The general idea is that if the product can have multiple values, based on the selected product variation, you can set the PriceTag price dynamically instead of setting its value when the product page is loaded.

PriceTag for the Cart Page

The Cart PriceTag settings

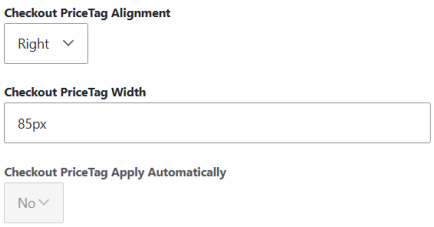

If you set the “Cart PriceTag Apply Automatically”, the PriceTag will be inserted automatically below the cart total price. If this does not work, you can manually insert the PriceTag in the proper twig template file (e.g. **modules/contrib/commerce/modules/order/templates/commerce-order-total-summary.html.twig**), using the following tag:

```
{% if viabill_pricetag %} {{ viabill_pricetag }} {% endif %}
```

For the PriceTag alignment (left, center, right) you can use the value of the “Cart PriceTag Alignment”. The PriceTag width also plays a significant role in the alignment and you can use it, especially when the “Right”

alignment is selected.

PriceTag for the Checkout

The Checkout PriceTag settings

If you set the “Checkout PriceTag Apply Automatically”, the PriceTag will be inserted automatically below the cart total price. In most configurations this is not available as an option, thus you can manually insert the PriceTag in the proper twig template file (e.g. **modules/contrib/commerce/modules/checkout/templates/commerce-checkout-order-summary.html.twig**), using the following tag:

```
{% if viabill_pricetag %} {{ viabill_pricetag }} {% endif %}
```

For the PriceTag alignment (left, center, right) you can use the value of the “Checkout PriceTag Alignment”. The PriceTag width also plays a significant role in the alignment and you can use it, especially when the “Right” alignment is selected.

Save Configuration

After setting the above fields, click **Save**. Test your configuration (especially if you're in Test Mode) to ensure that the payment gateway behaves as expected.

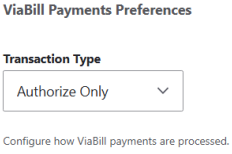

The Save button at the bottom of the gateway configuration

3 Authorize, Capture, Refund and Void a Payment

Authorize a payment

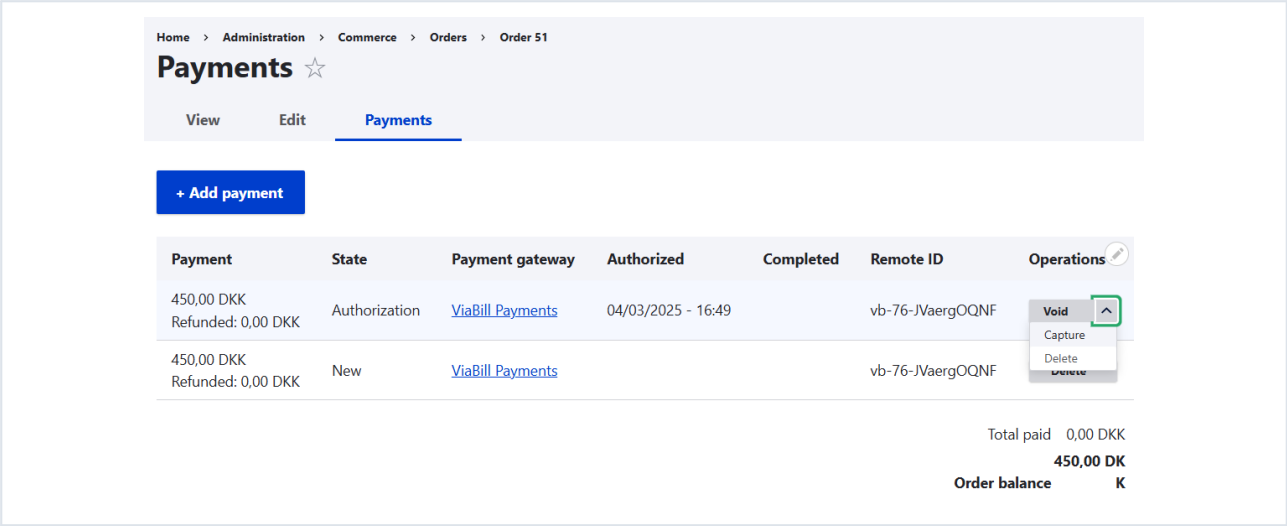

If you want to authorize only the payments and afterwards manually capture the payments, or void them, you will need to set the Transaction Type to “Authorize Only” in the module configuration page.

Transaction Type set to Authorize Only

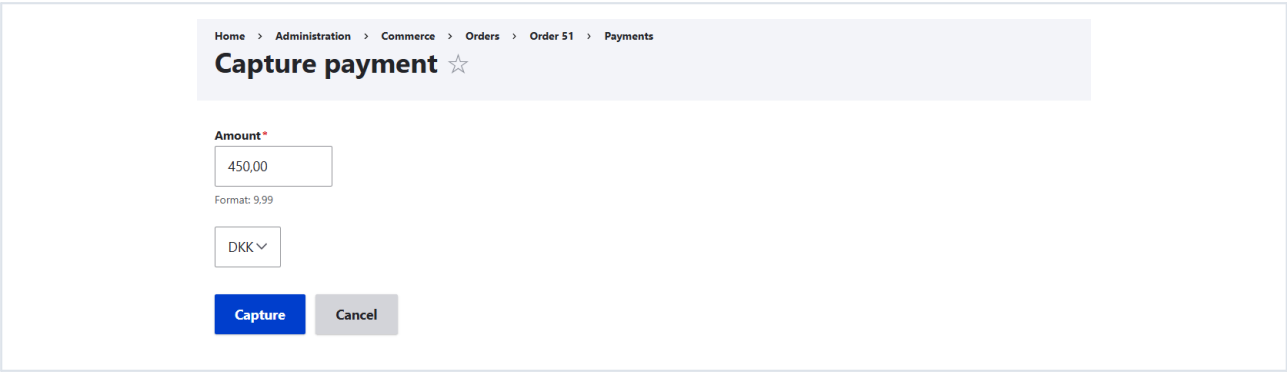

Capture a payment

You can only capture a payment if it is already authorized. Therefore, we assume that you have set the Transaction Type to “Authorize Only” and then you want to manually capture the payment. To do so, in an authorized payment, click on the **Capture** button to start the process.

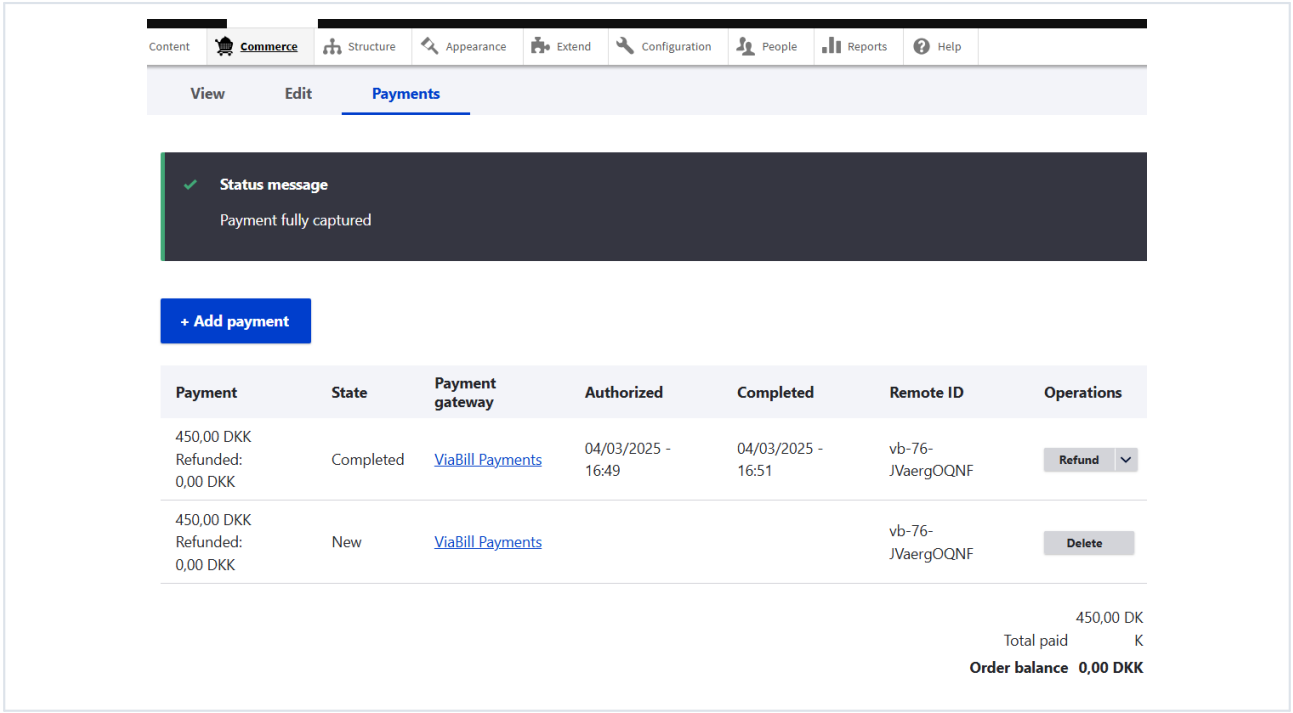

An authorized payment with the Capture operation available

In the capture form that appears, select the full amount (preselected/full capture), or an amount smaller than that (partial capture).

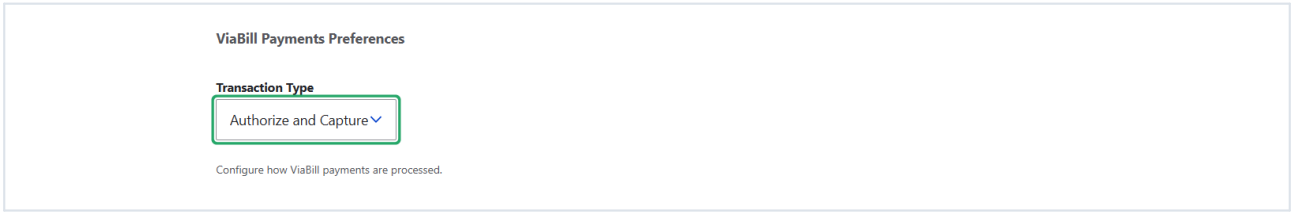

The capture form with the amount field

After a successful capture, the payment is marked as fully captured

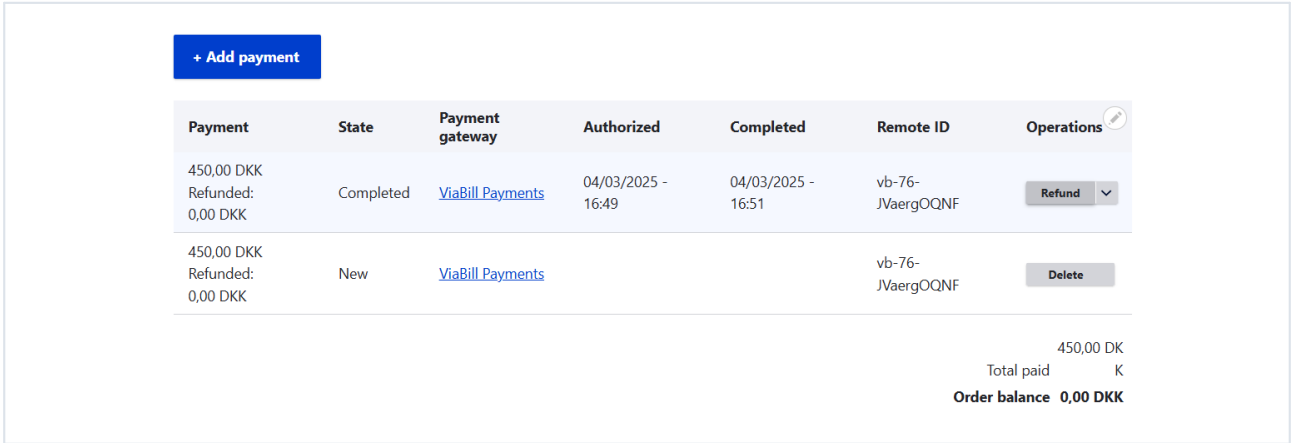

It is also possible to automatically capture the payment, if you set the Transaction Type to “Authorize and Capture”. In such case, after the payment the state becomes “completed” automatically.

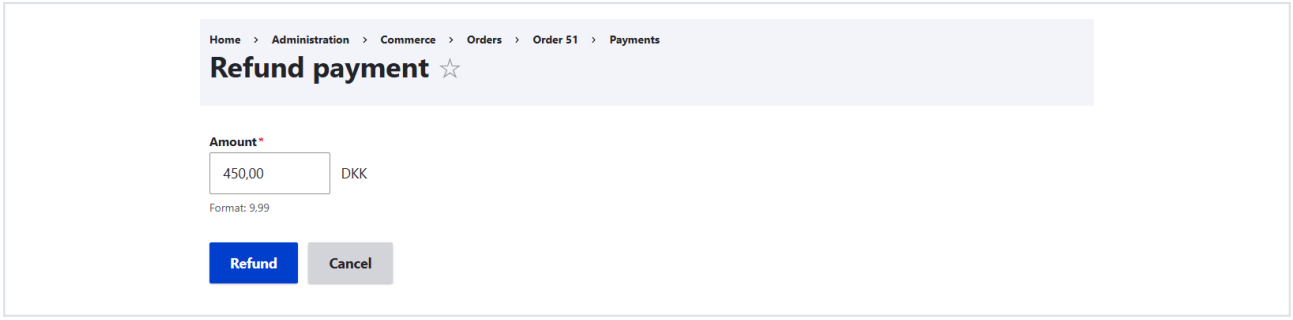

Transaction Type set to Authorize and Capture

Refund a payment

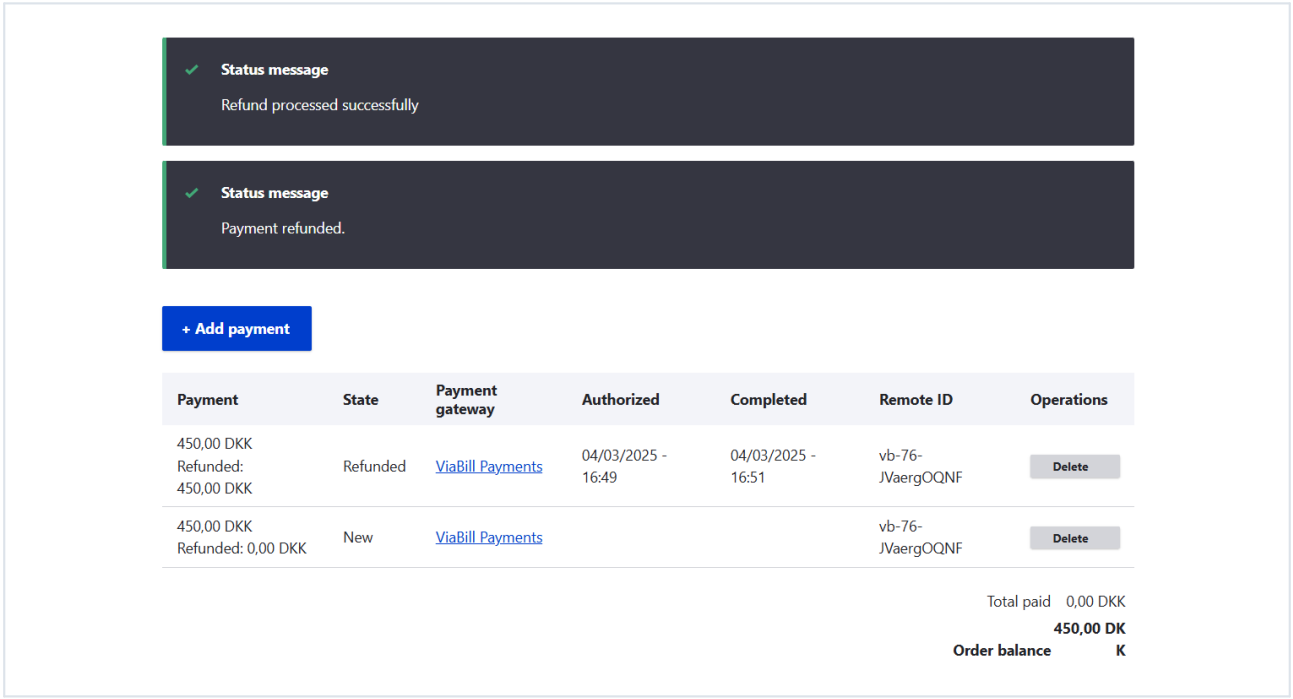

Please note that only a captured (completed) order can be refunded. In such case, the **Refund** button will be visible and if clicked you will be presented with the refund form to enter the desired refund amount.

A completed payment with the Refund operation available

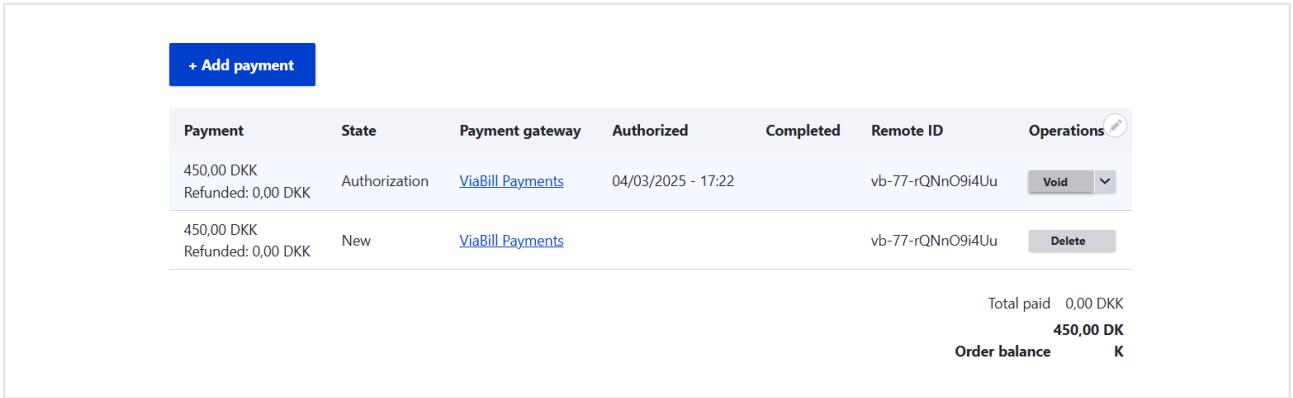

The refund form with the amount field

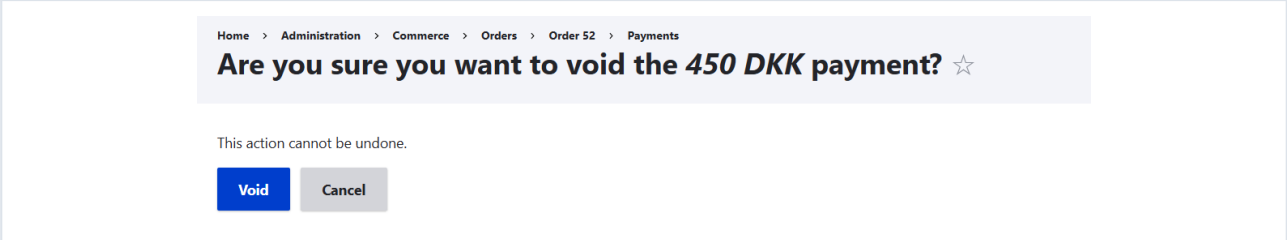

After a successful refund, the payment is marked as refunded

Void a payment

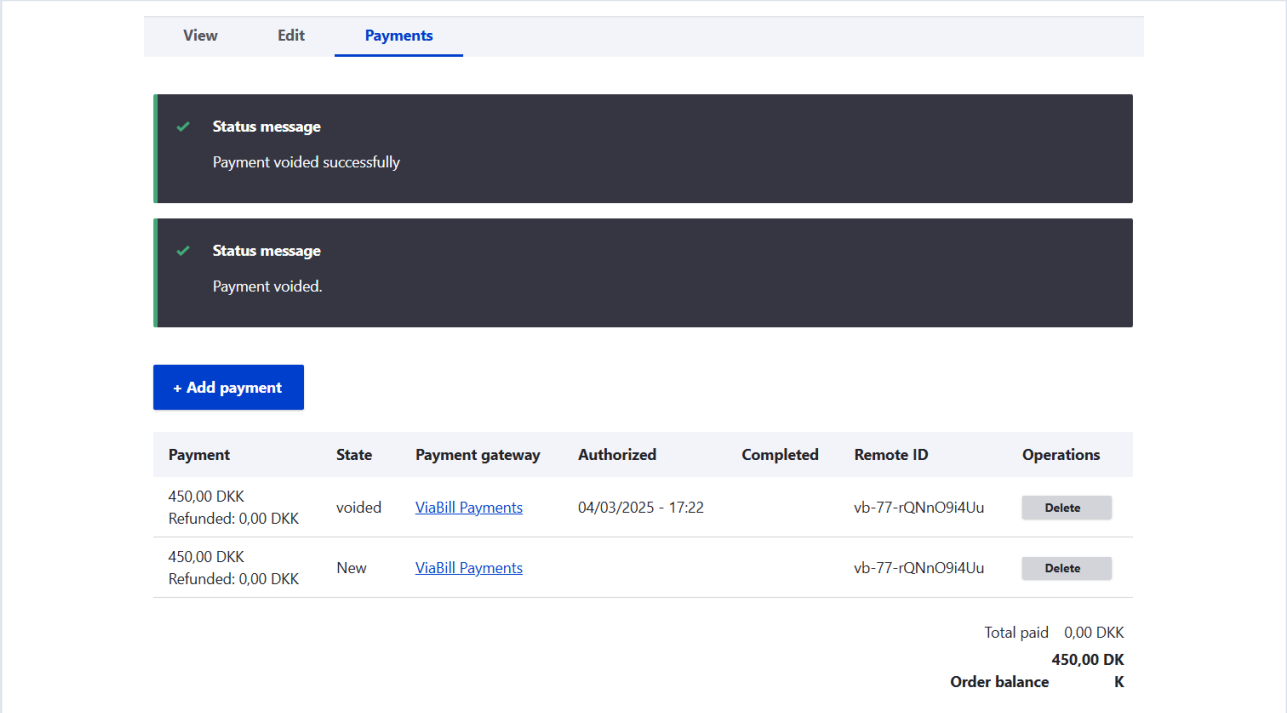

An authorized payment can also be canceled (void). Therefore, in order to void a payment it implies that you have set the Transaction Type to “Authorize Only” and you have already authorized the payment.

An authorized payment with the Void operation available

The void confirmation dialog

After a successful void, the payment is marked as voided

4 Best Practices

Practice	Details
Check Currency and Store Settings	Ensure your Drupal Commerce store currency matches the currency supported by ViaBill Payments (DKK or EUR).
Use Test Credentials	Always test the gateway in a non-production environment (Test Mode) to avoid real charges and refunds while setting up.
Enable HTTPS/SSL	Secure your site with HTTPS/SSL to protect sensitive information during payment transactions.
Monitor Logs	If something goes wrong, check the Drupal log (/admin/reports/dblog) and any logs provided by the payment gateway to troubleshoot.
Keep Modules Updated	Stay current with module updates to ensure compatibility with the latest Drupal and Commerce versions, as well as new security fixes.
